Based on my knowledge from w3school, I learned the use of HTML layout elements like header, summary, and section and each of it has different purposes, a header defines a header for a document or a section, the section defines a section in a document, and the section defines a heading for the `<details>` element. There are some of HTML layout elements I didn't use like nav, article, aside, footer, and details because I chose a better and unique in showing a details about my website.
